FIRE FIGHTING BOOSTING SETS

TECHNICAL DESCRIPTION OF FIRE FIGHTING BOOSTING SETS TYPE EDJ-EEJ

The fire fighting boosting sets of S.AIVAZIDIS S.A. company (ISO 9001 certified) are manufactured with the most modern and studied design providing high quality and effective solutions of fire extinguishing, in strict compliance with the requirements both of National Fire Service Dept. and the regulations (under request) NFPA-20 of USA or European Standard EN 12845+A2. They are able to be installed in public buildings, hotels, hospitals, theaters, cinemas, ships, factories, forest lands, etc for protection against fire. The materials used for its manufacture are made of optimum quality, selected after strict control inspection, closely following the predetermined production processes such as those analytical described in the manual quality assurance according ISO9001. All the manufactured fire fighting boosting sets of our company are CE certified.

The fire fighting boosting sets consisted of the following basic equipment:

TYPE EDJ / SERIES 32-40-50-65-80-100
Includes : electric driven pump / diesel driven pump / jockey pump)

- Electric driven pump set

Pump

Centrifugal single stage or multistage pump of S. AIVAZIDIS S.A. company, is horizontal (type "S") or vertical version. The centrifugal pump is connected with the electric motor through strong elastic joint on a advanced base frame being a sturdy group totally straight and balanced without vibrations, noiseless operation, suitable for "on the spot" assembly-disassembly service. The body and the impeller are manufactured from cast iron GG25 according to DIN 24255 and the shaft from stainless steel AISI420 (under request we can supply pumps with different materials such as bronze or stainless steel). The shaft abuts on two (2) close type ball bearings set located into the body of the pump. The sealing is achieved through packing ring or mechanical seal (under request).

Electric motor

The electric motor of S.AIVAZIDIS S.A. company type "SIGMA", is asynchronous, three phase, B3 according to DIN42673-42677-42769, VDE 0530 and IEC72-1,2. It is externally air-ventilated, protection degree IP54 according to DIN40050 and IEC publ. 34-5/1968 and protection degree IP65 for the terminal box, insulation class F according to VDE 0530 and dimensions according to DIN42673. The electric motors abut on suitable ball bearings of life time 20.000-30.000 hours. The rotor of the electric motor are balanced dynamically to the nominal rotation speed and then are rotated 20% more according to the VDE 0530 so as the vibrations of the electric motors to be much lower from the limits specified in the DIN 45665 during their operation.

- Diesel driven pump set

Pump

Centrifugal single stage or multistage pump of S. AIVAZIDIS S.A. company, is horizontal (type "S") or vertical version. The centrifugal pump is connected with the electric motor through strong elastic joint on a advanced base frame being a sturdy group totally straight and balanced without vibrations, noiseless operation, suitable for "on the spot" assembly-disassembly service. The body and the impeller are manufactured from cast iron GG25 according to DIN 24255 and the shaft from stainless steel AISI420 (under request we can supply pumps with different materials such as bronze or stainless steel). The shaft abuts on two (2) close type ball bearings set located into the body of the pump. The sealing is achieved through packing ring or mechanical seal (under request).

Diesel engine

The diesel engine is water or air-cooled, four stroke, rated power greater than 20% from pump absorbed power and it is suitable for continuous operation at +1000m and indoor installation with up to 45°C ambient temperature. The overload ability is 10% for one (1) hour in twelve (12) hours operation (DIN6270).

Also includes: Automatic mechanical governor - direct fuel injection system - starter 12V or 24V DC - dynamo - electromagnetic fuel valve - exhaust pipe - batteries - fuel tank.

- Electric driven pump set (jockey)

Pump

Centrifugal multistage or single stage pump, horizontal or vertical, self – priming or simple one. The jockey centrifugal pump is connected with the electric motor through strong elastic joint on an advance base frame being a sturdy group totally straight and balanced without vibrations and noiseless operation, suitable for “on the spot” assembly-disassembly service. The body is manufactured from stainless steel or cast iron GG25 according to DIN 24255, shaft from stainless steel AISI420 (under request we can supply pumps with different body material such as bronze or different impeller material such as NORYL). The sealing is achieved though packing ring or mechanical seal (under request).

Electric motor

The electric motor of S.AIVAZIDIS S.A. company type “SIGMA”, is asynchronous, three phase, B3 according to DIN42673-42677-42769, VDE 0530 and IEC72-1,2. It is externally air-ventilated, protection degree IP54 according to DIN40050 and IEC publ. 34-5/1968 and protection degree IP65 for the terminal box, insulation class F according to VDE 0530 and dimensions according to DIN42673. The electric motors abut on suitable ball bearings of life time 20.000-30.000 hours. The rotor of the electric motor are balanced dynamically to the nominal rotation speed and then are rotated 20% more according to the VDE 0530 so as the vibrations of the electric motors to be much lower from the limits specified in the DIN 45665 during their operation.

- Control panel

The control and operation electric panel of fire fighting boosting set, assures the automatic or manual operation of the set. It is sealed with protection degree IP54, manufactured from DKP iron with anti-rust and anti-corrosion painting. It carries Y/Δ contactors for the start of the main electric motor, direct on line contactor for the start of the jockey electric motor, manual – auto selection switch, thermal contactors, switches, fuses, indication lamps and auxiliary equipment which assures the automatic operation and protection of the boosting set.

OPERATION:

- A) Manual operation: Each pump starts and stops no matter the system pressure in case we set the optional switch in “MANUAL” position.
- B) Automatic operation: Three (3) pressure switches are used for the interruption of the pumps operation at their nominal pressure. Any water leakages are compensated from the expansion vessel, whereas the jockey pump compensates greater water leakages, then the electric driven and last the diesel driven pump is also activated though its electric start system. Diesel engine start failure is indicated by audio-visual signal. Also the panel carries battery charger so as the batteries to be always ready to be used. It carries also protection of the pumps against lack of water.

- Expansion vessel

Expansion vessels of capacity from 200lt up to 1000lt are manufactured from special mixed metal of European origin which is not getting rusted. The vessel is separated with BUTYL membrane in two spaces. The above space is filled with air of suitable pressure and the below space is filled with water of the fire fighting system. The membrane is suitable for slightly drain water and can operate clearly up to 16atm working pressure. Expansion vessel equipped with air compressor (without membrane) is manufactured for working pressures greater than 15atm without regard to capacity.

- Hydraulic equipment

The collectors are manufactured from TUBO tubes with no welding. All the hydraulic equipment such as, gate valves, check valves, flanged systolic fittings according to ASA, as well as bronze gate valves and check valves for the jockey, are carefully and strictly selected for long time operation and high quality construction.

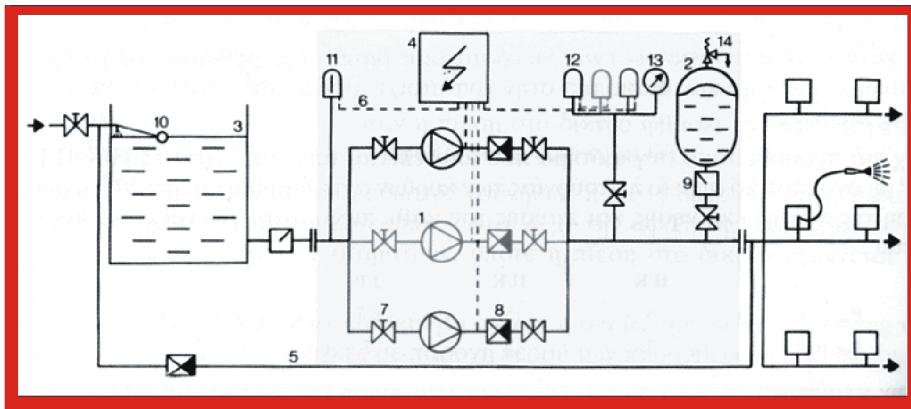

TYPE EEJ / SERIES 32-40-50-65-80-100.

Includes : two (2) units of electric driven pump / jockey pump

The technical description is similar to the mentioned one, except the diesel motor which is replaced by electric motor.

Each fire fighting boosting set is tested and calibrated in our facilities before its delivery.
